Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

10/065,566

Applicant(s)

CHANG, YI-CHEN

Examiner

Amare Mengistu

Art Unit

2629

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 22 May 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-20 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-20 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-5, 7, 8, 10, 12-16 and 18-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Sekiya et al (6,583,775)** in view of **Ting (6,486,606B1)**..

In regard to claim 1, **Sekiya** discloses a driving circuit, depicted in figure 1, for a display device having a plurality of pixels. See column 6, lines 30-32, disclosing, "there is provided an image display apparatus, comprising a plurality of pixels arranged in a matrix". **Sekiya** further discloses that driving circuit is used for driving the light-emitting device in each pixel. See column 10, lines 58-60, disclosing, "The light emitting element OLED emits light with a brightness value which varies depending upon the amount of current supplied thereto."

Sekiya further discloses that the driving circuit comprises a light-emitting device driving unit coupled to the light-emitting device for providing a driving current to the light-emitting device selectively. See column 10, lines 64-67, disclosing, "The second thin film transistor TFT2 controls the amount of current to be supplied to the light emitting

Art Unit: 2629

element OLED in response to the brightness information written in the holding capacitor C.”

Sekiya further discloses that the driving circuit comprises a discharging unit coupled to the light-emitting device driving unit for discharging light-emitting device according to the voltage level of a control signal. See column 11, lines 29-33, disclosing, “When a third thin film transistor TFT 3 is placed into an on state with the control signal, the corresponding holding capacitor Cs discharges and the gate-source voltage Vgs of the second thin film transistor TFT2 becomes 0 V. Consequently, the current to flow to the light emitting element OLED is cut off.” **Sekiya**, did not expressly detailed discharging the light emitting device.

Ting is cited to teach that it is well known to discharge the OLED (see, col.1, lines 65 –col.2, lines 4,46-57, col.3, lines 30-50).

Therefore, it would have been obvious to one skill in the art at the time of the invention was made to have been motivated to incorporate the discharging the OLED method of **Ting** into the device of **Sekiya**, because this will allow to have uniform luminescence of individual pixels without requiring a back light and provide less weight.

In regard to claim 2, **Sekiya** discloses that the driving circuit may further include a light-emitting device selection unit coupled to the light-emitting device driving unit for receiving a scan signal and a data signal. See figure 1 and column 10, lines 60-63, disclosing, “The first active element TFT1 is controlled by the corresponding scanning

line X and writes brightness information given thereto from the corresponding data line Y into the holding capacitor Cs included in the pixel PXL."

Sekiya further discloses that when the scan signal and the data signal are at logic level "1", the light-emitting device selection unit enables the light-emitting device driving unit to provide a driving current to the light-emitting device. See column 10, line 67 to column 11, line 4, disclosing, "The writing of the brightness information into the pixel PXL is performed by applying an electric signal (data potential Vdata) corresponding to the brightness information to the data line Y in a state wherein the scanning line X is selected." It is understood that a selected scanning line and a data line with brightness information are at a logic level "1".

In regard to claim 3, **Sekiya** discloses that the control signal uses the scan signal from the next pixel. See column 15, lines 15-18, disclosing an embodiment in which "no special stopping control line is provided, but duty control of the pixels PXL is performed making use of the scanning lines X1 to XN. To this end, in place of the stopping control line drive circuit 23, a control circuit 23' is provided separately from the scanning line drive circuit 21." Further see figure 8 and note that control circuit 23' uses scanning lines from the scanning line drive circuit 21. **Ting** also discloses that the light emitting device unit provides a driving current to the light-emitting device of the next pixel, the discharging unit discharging the light-emitting device (see, 3, lines 30-58).

In regard to claim 4, **Sekiya** further discloses that the discharging unit discharges the light-emitting device when the scan signal on the next pixel is at a logic level "1" or a high voltage level. See rejection of claim 3 and column 16, lines 17-24, disclosing, "scanning line X is selected when the corresponding output of the control circuit 23' is H (high level) and the vertical clock signal VCK is VCK=H (high level)...the pixels connected to a scanning line X selected by the control circuit 23' stop the emission of light".

In regard to claim 5, **Sekiya** discloses that the discharging unit is coupled to a ground potential so that electric charges are discharged from the light-emitting device to the ground. Note in figure 1 that the source of TFT3 is connected to ground.

In regard to claim 7, see rejection of claim 1.

In regard to claim 8, **Sekiya** discloses that the gate terminal of the transistor is connected to the control signal terminal. See rejection of claim 1 and column 11, lines 25-27, disclosing, "The control signal is applied over a stopping control line Z...to the third thin film transistors TFT3". Note in figure 1 that the gate of TFT3 is connected to line Z.

Sekiya further discloses that the drain terminal of the transistor is connected to a ground potential so that electric charges in the light-emitting device discharge to the ground when the transistor is turned on by the control signal. See rejection of claim 5.

Art Unit: 2629

Note that the drain of TFT3 is connected to ground when TFT3 receives a control signal at its gate.

In regard to claim 10, see rejection of claim 1.

In regard to claim 12, see rejection of claim 1.

In regard to claim 13, see rejection of claim 2.

In regard to claim 14, see rejection of claim 3.

In regard to claim 15, see rejection of claim 4.

In regard to claim 16, see rejection of claim 5.

In regard to claim 18, see rejection of claim 1.

In regard to claim 19, see rejection of claim 2.

In regard to claim 20, see rejection of claim 3.

3. Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over **Sekiya et al. (6,583,775 B1)** in view of **Ting (6,486,606B1)** and **Hack et al. (2002/0030647 A1)**.

In regard to claim 11, **Sekiya** (as modified by **Ting**) discloses an invention similar to that which is claimed in claim 11. See rejection of claim 1 for similarities. **Sekiya** does not disclose that the light-emitting device includes a molecular light-emitting diode.

Hack discloses in paragraph [0056], "in the preferred embodiments of the present invention, the phosphorescent emission is produced by the radiative emission from triplet excited states of phosphorescent molecules in the emissive layer. The phosphorescent molecules are excited to their triplet excited states by the energy

provided by the recombination of the holes and electrons that are produced in the emissive layer when a voltage is applied across an OLED.” These phosphorescent OLEDs are molecular light-emitting diodes, as best understood.

Hack further teaches the use of such phosphorescent OLEDs in paragraph [0013], “There is, in addition, a need to combine these improved lower cost pixel circuits with OLEDs that also have improved performance characteristics. In particular, due to the many benefits and advantages that are provided by OLEDs, especially including overall energy efficiency, there has been much effort in recent years to find materials having still further improved OLED electroluminescent efficiencies...More recent work has demonstrated that OLEDs with higher power efficiencies can be made using organic molecules that emit light from their triplet state, defined as phosphorescence...phosphorescent OLEDs have a theoretical internal quantum efficiency of 100% ...As a consequence, since the discovery that phosphorescent materials could be used in an OLED, there has been much interest in developing displays that can effectively utilize the unusually high electroluminescent efficiencies that are possible for phosphorescent OLEDs.”

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the invention of **Sekiya** by having the light-emitting device include a molecular light-emitting diode, as in the invention of Hack. One would have been motivated to make such a change based on the teaching of Hack that such diodes have “unusually high electroluminescent efficiencies” and “improved performance characteristics”.

4. Claims 6, 9 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Sekiya et al.** (6,583,775 B1) in view of **Ting (6,486,606B1) and Filliman (5,255,220)**.

In regard to claim 6, **Sekiya** (as modified by **Ting**) discloses an invention similar to that which is disclosed in claim 6. See rejection of claims 1 and 5 for similarities. Note in the rejection of claim 5 that **Sekiya** discloses that the discharging unit is coupled to a ground potential so that electric charges are discharged from the light-emitting device to the ground. **Sekiya** does not, however, disclose that the discharging unit is coupled to a negative voltage so that electric charges are discharged from the light-emitting device to the negative voltage terminal.

Filliman discloses an invention in which discharge occurs when a transistor is connected to a negative voltage. See figure 3 and column 6, lines 21-23, disclosing that the transistor Q1 "will discharge the storage node 305 if the write data input row to which terminal 302 is low (i.e., ground or negative)."

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the invention of **Sekiya** by having the discharging unit coupled to a negative voltage instead of ground so that the electric charges are discharged from the light-emitting device to the negative voltage terminal, as in the invention of **Filliman**. One would have been motivated to make such a change based on the teaching of **Filliman** that discharge will occur to a low terminal, which is also true

Art Unit: 2629

of the invention of **Sekiya**, and based on the further teaching of **Filliman** that such a low terminal is a “ground or negative”.

In regard to claims 9 and 17, see rejection of claim 6.

Response to Arguments

5. Applicant's arguments with respect to claims 1-20 have been considered but are moot in view of the new ground(s) of rejection.

On page 12, Applicant states that Ting does not teach, suggest or disclose nothing about discharging operation of the LED. Ting teaches “*the discharging current from the capacitor drives the OLED luminescent*” (column 2, lines 56 and 57), “*the transistor T2 is switched on by applying a discharging signal on the discharging line*”, and “[S]ince the capacitor is connected to the OLED via the transistor T2, a discharging current from the capacitor drives the OLED luminescent” (column 3, lines 6-9). More evidences can be found throughout the disclosure of Ting that the discharging signal is employed for applying on the discharging line to switch on the transistor T2 and allowing a discharging current from the capacitor to drive the OLED luminescent.

Here note that the Applicant admits that Ting discloses (column 3, lines 6-9) “[S]ince the capacitor is connected to the OLED via the transistor T2, a discharging current from the capacitor drives the OLED luminescent”.

Thus, Ting clearly teaches discharging the OLED from the capacitor.

Furthermore, Ting also discloses (in col.2, lines 55-57) *"the second transistor is switched on with the discharged line and the capacitor is discharged. Therefore, the discharged current from the capacitor drives the OLED luminescent"*. That is, the discharge is applied from the capacitor to the OLED.

Conclusion

6. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
